To: Whom It May Concern,

We are leaving global warming due to the lack of sunspot activity.

- Per Joseph D'Aleo, we are in a new "100" year series of sunspot cycles
- The present sunspot cycle is matching the 1700 and 1800 sunspot cycles
- The 1700 and 1800 sunspot cycles were weaker/colder than the five cycles from 1878 to 1933 (Mini-Ice Age was approximately 1600 to 1750)
- The weaker sunspot cycles come in pairs (2008 + 11 + 11 years + climate lag time), which will drop lake levels to unknown levels until 2030 + 5 to 14 years
- Our official weather data begins in 1895
- Experts must estimate below the given weather data for 1895 to 1932 for precipitation, hurricane activity and temperatures.
- It is going to get colder, maybe somewhat severe

As stated in the January 2009 letter the following holds true.

- There is a dramatic downward change in the 2009 Atlantic Ocean hurricane season's length and strength
- Web sites tell of significant increase in glacier and Polar Region ice
- Change: Drought conditions could last not 10 years, but 20 to 30 years or longer
- The lower lake levels under the conditions stated in the new report should reveal more crime scenes and eventually archeological artifacts dating back 300+ years
- *We are closer to a mini-ice age than the dinosaur age of a greenhouse earth*

Sincerely,

Paul Pierett
